QUINAZOLINE DERIVATIVES AND THEIR USE AS PHARMACEUTICALS

The present invention relates to certain quinazoline derivatives for use in the treatment of certain diseases in particular to proliferative disease such as cancer and in the preparation of medicaments for use in the treatment of proliferative disease, to novel quinazoline compounds and to processes for their preparation, as well as pharmaceutical compositions containing them as active ingredient.

Cancer (and other hyperproliferative disease) is characterised by uncontrolled cellular proliferation. This loss of the normal regulation of cell proliferation often appears to occur as the result of genetic damage to cellular pathways that control progress through the cell cycle.

In eukaryotes, the cell cycle is largely controlled by an ordered cascade of protein phosphorylation. Several families of protein kinases that play critical roles in this cascade have now been identified. The activity of many of these kinases is increased in human tumours when compared to normal tissue. This can occur by either increased levels of expression of the protein (as a result of gene amplification for example), or by changes in expression of co activators or inhibitory proteins.

The first identified, and most widely studied of these cell cycle regulators have been the cyclin dependent kinases (or CDKs). Activity of specific CDKs at specific times is essential for both initiation and coordinated progress through the cell cycle. For example, the CDK4 protein appears to control entry into the cell cycle (the G0-G1-S transition) by phosphorylating the retinoblastoma gene product pRb. This stimulates the release of the transcription factor E2F from pRb, which then acts to increase the transcription of genes necessary for entry into S phase. The catalytic activity of CDK4 is stimulated by binding to a partner protein, Cyclin D. One of the first demonstrations of a direct link between cancer and the cell cycle was made with the observation that the Cyclin D1 gene was amplified and cyclin D protein levels increased (and hence the activity of CDK4 increased) in many human tumours (Reviewed in Sherr, 1996, Science 274: 1672-1677; Pines, 1995, Seminars in Cancer Biology 6: 63-72). Other studies (Loda et al., 1997, Nature Medicine 3(2): 231-234; Gemma et al., 1996, International Journal of Cancer 68(5): 605-11; Elledge et al. 1996, Trends in Cell

Biology 6; 388-392) have shown that negative regulators of CDK function are frequently down regulated or deleted in human tumours again leading to inappropriate activation of these kinases.

More recently, protein kinases that are structurally distinct from the CDK family have been identified which play critical roles in regulating the cell cycle and which also appear to be important in oncogenesis. These include the newly identified human homologues of the *Drosophila* aurora and *S.cerevisiae* Ipl1 proteins. *Drosophila* aurora and *S.cerevisiae* Ipl1, which are highly homologous at the amino acid sequence level, encode serine/threonine protein kinases. Both aurora and Ipl1 are known to be involved in controlling the transition from the G2 phase of the cell cycle through mitosis, centrosome function, formation of a mitotic spindle and proper chromosome separation / segregation into daughter cells. The two human homologues of these genes, termed aurora1 and aurora2, encode cell cycle regulated protein kinases. These show a peak of expression and kinase activity at the G2/M boundary (aurora2) and in mitosis itself (aurora1). Several observations implicate the involvement of human aurora proteins, and particularly aurora2 in cancer. The aurora2 gene maps to chromosome 20q13, a region that is frequently amplified in human tumours including both breast and colon tumours. Aurora2 may be the major target gene of this amplicon, since aurora2 DNA is amplified and aurora2 mRNA overexpressed in greater than 50% of primary human colorectal cancers. In these tumours aurora2 protein levels appear greatly elevated compared to adjacent normal tissue. In addition, transfection of rodent fibroblasts with human aurora2 leads to transformation, conferring the ability to grow in soft agar and form tumours in nude mice (Bischoff et al., 1998, The EMBO Journal. 17(11): 3052-3065). Other work (Zhou et al., 1998, Nature Genetics. 20(2): 189-93) has shown that artificial overexpression of aurora2 leads to an increase in centrosome number and an increase in aneuploidy.

Importantly, it has also been demonstrated that abrogation of aurora2 expression and function by antisense oligonucleotide treatment of human tumour cell lines (WO 97/22702 and WO 99/3778) leads to cell cycle arrest in the G2 phase of the cell cycle and exerts an antiproliferative effect in these tumour cell lines. This

indicates that inhibition of the function of aurora2 will have an antiproliferative effect that may be useful in the treatment of human tumours and other hyperproliferative diseases.

A number of quinazoline derivatives have been proposed hitherto for use in the inhibition of various kinases. For example, WO 96/09294, WO 96/33981 and EP 0837 063 describe the use of certain quinazoline compounds as receptor tyrosine kinase inhibitors, which may be useful in the treatment of proliferative disease.

The applicants have found a series of compounds which inhibit the effect of the aurora2 kinase and which are thus of use in the treatment of proliferative disease such as cancer, in particular in such diseases such as colorectal or breast cancer where aurora 2 kinase is known to be active.

The present invention provides the use of a compound of formula (I)

17') $C_{1-3}alkylX^9C_{1-3}alkylR^{36}$ (wherein X^9 and R³⁶ are as defined in (5') above).

Preferably Y is a carbon atom or an S(O) group, and is most preferably carbon.

15 Examples of R⁶⁵ include R⁹ or OR⁹ groups where R⁹ is hydrogen, optionally substituted C₁₋₆alkyl or optionally substituted aryl such as optionally substituted phenyl. Suitable substituents for alkyl or aryl groups R⁹ include functional groups as defined above but in particular nitro, halo such as fluoro or cyano.

Further examples of R⁶⁵ groups include NR¹⁰R¹¹ where at least one of R¹⁰ or R¹¹ is hydrogen and the other is selected from hydrogen, optionally substituted C₁₋₆alkyl, optionally substituted aryl or optionally substituted heterocyclyl. Suitable optional substituents for R¹⁰ or R¹¹ include functional groups as defined above but in particular nitro, halo such as fluoro or cyano, haloalkyl such as trifluoromethyl, alkoxy such as methoxy. Alkyl groups R¹⁰ or R¹¹ may also be substituted with aryl, cycloalkyl, cycloalkenyl, cycloalkynyl or heterocyclic groups, any of which may themselves be substituted with a functional group such as halo, or an alkyl group such as methyl. Aryl and heterocyclic groups R¹⁰ and R¹¹ may be substituted with alkyl groups such as methyl.

In a particular embodiment, the group Y(O)R⁶⁵ is a group of sub-formula (VII)

(VII)

where R^{66} and R^{67} are independently selected from hydrogen, optionally substituted hydrocarbyl or optionally substituted heterocyclyl, or R^{66} and R^{67} together with the nitrogen atom to which they are attached form an optionally substituted heterocyclic ring.

Examples of groups for R^{66} and R^{67} include the group $-(CH_2)_q R^{70}$ where q and R^{70} are as defined above in relation to formula (III).

Suitably one of R^{66} or R^{67} is hydrogen, or methyl, ethyl or propyl optionally substituted with hydroxy and preferably one of R^{66} or R^{67} is hydrogen. In this case, the other is suitably a larger substituent for example of at least 4 carbon or heteroatoms, and is optionally substituted hydrocarbyl or optionally substituted heterocyclyl. Particular optionally substituted hydrocarbyl groups for R^{66} or R^{67} include alkyl, cycloalkyl, alkenyl, or aryl any of which is optionally substituted with a functional group as defined above, or in the case of aryl groups, with an alkyl group and in the case of alkyl group, with an aryl or heterocyclic group either of which may themselves be optionally substituted with alkyl or a functional group. Examples of optionally substituted aryl groups R^{66} or R^{67} include phenyl optionally substituted with one or more groups selected from C_{1-6} alkyl group such as methyl or ethyl (either of which may be optionally substituted with a functional group such as hydroxy), or a functional group as defined above (such as halo like fluoro, chloro or bromo, hydroxy, alkoxy such as methoxy, trifluoromethyl, nitro, cyano, trifluoromethoxy, $CONH_2$, $C(O)CH_3$, amino, or dimethylamino).

When R^{66} or R^{67} is an optionally substituted alkyl group, it is suitably a C_{1-6} alkyl group, optionally substituted with one or more functional groups (such as cyano, hydroxy, alkoxy, in particular methoxy, COO alkyl such as $COOCH_3$), or aryl optionally substituted with a functional group as defined above (in particular in

relation to R⁶⁶ or R⁶⁷ themselves, or an optionally substituted heterocyclic group such as N-methyl pyrrole.

When R⁶⁶ or R⁶⁷ is optionally substituted cycloalkyl, it is suitable cyclohexyl optionally substituted with a functional group such as hydroxy.

5 When R⁶⁶ or R⁶⁷ is optionally substituted alkenyl, it is suitably prop-2-enyl.

When R⁶⁶ or R⁶⁷ is optionally substituted heterocyclyl, or R⁶⁶ and R⁶⁷ together form a heterocyclic group, then this may be aromatic or non-aromatic and includes in particular, piperidine, piperazine, morpholino, pyrrolidine or pyridine any of which may be optionally substituted with a functional group such as hydroxy, alkoxy such as methoxy, or alkyl such as methyl which may itself be substituted with for instance a hydroxy group.

Suitable prodrugs of compounds of formula (I) are groups which enhance solubility and include phosphates and sulphates, in particular phosphates as well as alkyl, aryl or aralkyl derivatives thereof such as dibenzylphosphate. The prodrug moiety may be attached at any suitable position in the molecule, for example as a derivative of a hydroxy group, but in particular, may be advantageously present on one or more of groups R¹, R², R³ or R⁴, and preferably at R² or R³.

Suitable pharmaceutically acceptable salts of compounds of formula (I) include acid addition salts such as methanesulfonate, fumarate, hydrochloride, hydrobromide, citrate, maleate and salts formed with phosphoric and sulphuric acid. There may be more than one cation or anion depending on the number of charged functions and the valency of the cations or anions. Where the compound of formula (I) includes an acid functionality, salts may be base salts such as an alkali metal salt for example sodium, an alkaline earth metal salt for example calcium or magnesium, an organic amine salt for example triethylamine, morpholine, *N*-methylpiperidine, *N*-ethylpiperidine, procaine, dibenzylamine, *N,N*-dibenzylethylamine or amino acids for example lysine. A preferred pharmaceutically acceptable salt is a sodium salt.

An *in vivo* hydrolysable ester of a compound of the formula (I) containing carboxy or hydroxy group is, for example, a pharmaceutically acceptable ester which is hydrolysed in the human or animal body to produce the parent acid or alcohol.

Suitable pharmaceutically acceptable esters for carboxy include C₁₋₆alkyl esters such as methyl or ethyl esters, C₁₋₆alkoxymethyl esters for example methoxymethyl, C₁₋₆alkanoyloxymethyl esters for example pivaloyloxymethyl, phthalidyl esters, C₃₋₈cycloalkoxy-carbonyloxyC₁₋₆alkyl esters for example

5 1-cyclohexylcarbonyloxyethyl; 1,3-dioxolene-2-onylmethyl esters for example 5-methyl-1,3-dioxolene-2-onylmethyl; and C₁₋₆alkoxycarbonyloxyethyl esters for example 1-methoxycarbonyloxyethyl and may be formed at any carboxy group in the compounds of this invention.

An *in vivo* hydrolysable ester of a compound of the formula (I) containing a

10 hydroxy group includes inorganic esters such as phosphate esters and α -acyloxyalkyl ethers and related compounds which as a result of the *in vivo* hydrolysis of the ester breakdown to give the parent hydroxy group. Examples of α -acyloxyalkyl ethers include acetoxymethoxy and 2,2-dimethylpropionyloxymethoxy. A selection of *in vivo* hydrolysable ester forming groups for hydroxy include alkanoyl, benzoyl,

15 phenylacetyl and substituted benzoyl and phenylacetyl, alkoxycarbonyl (to give alkyl carbonate esters), dialkylcarbamoyl and *N*-(dialkylaminoethyl)-*N*-alkylcarbamoyl (to give carbamates), dialkylaminoacetyl and carboxyacetyl.

Suitable amides are derived from compounds of formula (I) which have a carboxy group which is derivatised into an amide such as a *N*-C₁₋₆alkyl and *N,N*-di-

20 (C₁₋₆alkyl)amide such as *N*-methyl, *N*-ethyl, *N*-propyl, *N,N*-dimethyl, *N*-ethyl-*N*-methyl or *N,N*-diethylamide.

Esters which are not *in vivo* hydrolysable may be useful as intermediates in the production of the compounds of formula (I).

Particular examples of compounds of formula (I) are set out in Tables 1-16

 5 when said one of R⁶⁸ or R⁶⁹ is morpholinopropoxy, the other is not a group of sub-formula (18); and further provided that when said one of R⁶⁸ or R⁶⁹ is methoxyethoxy, the other is not methoxy.

Particular examples are compounds of formula (VIB)

20 In another embodiment, the invention provides a compound of formula (VID) which is of similar structure to (VIA) above but in which X, Y, R¹, R⁴, R⁶, R⁷, R⁸ and R⁶⁵ are as defined in relation to formula (VI), R⁶⁸ is halo, cyano, nitro, trifluoromethyl, C₁₋₃alkyl, -NR¹³R¹⁴ (wherein R¹³ and R¹⁴ are as defined above in relation to formula (I), or a group -X¹R¹⁵ where X¹ and R¹⁵ are as defined in relation

to formula (I) and R^{15} is particularly a group of sub group (1) or (10), and R^{69} is C_{1-6} alkoxy optionally substituted by fluorine or a group $X^{12}R^{71}$ in which X^{12} is selected from a group defined for X^1 above, and R^{71} is a heterocyclic group, and in particular a 5-6-membered aromatic heterocyclic group (linked via nitrogen) with 1-3

Compounds of formula (I) may be prepared by methods known in the art or by analogous methods. For example, a compound of formula (I) can be prepared by
 20 reacting a compound of formula (VIII)

(VIII)

where $R^{1'}$, $R^{2''}$, $R^{3'}$, and $R^{4'}$ are equivalent to a group R^1 , R^2 , R^3 and R^4 as
 25 defined in relation to formula (I) or a precursor thereof, and R^{85} is a leaving group, with a compound of formula (IX)

(IX)

where X, R⁵, R⁷ and R⁸ are as defined in relation to formula (I), and thereafter if desired or necessary converting a group R^{1'}, R^{2''}, R^{3''} or R^{4'} to a group R¹, R², R³ and R⁴ respectively or to a different such group.

Suitable leaving groups for R⁸⁵ include halo such as chloro, mesylate and tosylate. The reaction is suitably effected in an organic solvent such as an alcohol like isopropanol, at elevated temperatures, conveniently at the reflux temperature of the solvent.

The conversion of a group R^{1'}, R^{2''}, R^{3''} or R^{4'} to a group R¹, R², R³ and R⁴ respectively or to a different such group, may be particularly useful in connection with the preparation of compounds of formula (IIB) and examples of these preparations are provided hereinafter.

Compounds of formula (VIII) and (IX) are either known compounds or they can be derived from known compounds by conventional methods.

The use of such methods for producing novel compounds of the invention form a further aspect of the invention. Thus the invention further provides a method for preparing a compound of formula (IIA), (IIB), (IIC), (IID), (VIA) or (VIB), which method comprises reacting a compound of formula (VIII')

(VIII')

where $R^{1'}$ is equivalent to the corresponding group of formula R^1 as defined in relation to the said compound of formula (IIA), (IIB), (IIC), (IID), (VIA) or (VIB), or a precursor thereof;

$R^{2'}$ is equivalent to the corresponding group of formula R^2 or $R^{2'}$ or R^{68} as defined in relation to the said compound of formula (IIA), (IIB), (IIC), (IID), (VIA) or (VIB), or a precursor thereof;

$R^{3'}$ is equivalent to the corresponding group of formula R^3 or $R^{3'}$ or R^{69} as defined in relation to the said compound of formula (IIA), (IIB), (IIC), (IID), (VIA) or (VIB), or a precursor thereof;

$R^{4'}$ is equivalent to the corresponding group of formula R^4 as defined in relation to the said compound of formula (IIA), (IIB), (IIC), (IID), (VIA) or (VIB), or a precursor thereof;

R^6 is a group R^6 where present in the compound of any one of formula (IIA), (IIB), (IIC), (IID), (VIA) or (VIB), or is hydrogen where absent, and R^{85} is a leaving group, with a compound of formula (IX')

(IX')

where X , R^7 and R^8 are as defined in relation to the relevant compound according to any one of claims 19 to 26, and R^{86} is a group of formula $NHZR^{64}$ or $Y(O)R^{65}$ where Z , R^{64} , Y and R^{65} as are defined in the relation to the said compound in any one of claims 19 to 26; and thereafter if desired or necessary converting a group $R^{1'}$, $R^{2'}$, $R^{3'}$ or $R^{4'}$ to a group R^1 , R^2 or $R^{2'}$ or R^{68} , R^3 or $R^{3'}$ or R^{69} and R^4 respectively or to a different such group.

Compounds of formula (I) are inhibitors of aurora 2 kinase. As a result, these compounds can be used to treat disease mediated by these agents, in particular proliferative disease.

According to a further aspect of the present invention there is provided a method for inhibiting aurora 2 kinase in a warm blooded animal, such as man, in need of such treatment, which comprises administering to said animal an effective amount of a compound of formula (I), or a pharmaceutically acceptable salt, or an *in vivo* hydrolysable ester, or amide or prodrug thereof.

Novel compounds of formula (I) have not hitherto been proposed for use in therapy. Thus, according to a further aspect of the invention there is provided a compound of the formula (IIA), (IIB) or (VIA) as defined herein, or a pharmaceutically acceptable salt or an *in vivo* hydrolysable ester, or amide or prodrug thereof, for use in a method of treatment of the human or animal body by therapy. In particular, the compounds are used in methods of treatment of proliferative disease such as cancer and in particular cancers such as colorectal or breast cancer where aurora 2 is upregulated.

Compounds of formula (I) are suitably applied in the form of a pharmaceutical composition. Preferred compounds of formula (I) for use in the compositions of the invention are as described above.

Some of these are novel and form yet a further aspect of the invention. Thus, the invention also provides a pharmaceutical composition comprising a compound of formula (IIA), (IIB) or (VIA) as defined herein, or a pharmaceutically acceptable salt, or an *in vivo* hydrolysable ester thereof, in combination with at pharmaceutically acceptable carrier.

The compositions of compounds of formula (I) may be in a form suitable for oral use (for example as tablets, lozenges, hard or soft capsules, aqueous or oily suspensions, emulsions, dispersible powders or granules, syrups or elixirs), for topical use (for example as creams, ointments, gels, or aqueous or oily solutions or suspensions), for administration by inhalation (for example as a finely divided powder or a liquid aerosol), for administration by insufflation (for example as a finely divided powder) or for parenteral administration (for example as a sterile aqueous or oily solution for intravenous, subcutaneous, intramuscular or intramuscular dosing or as a suppository for rectal dosing).

The compositions of the invention may be obtained by conventional procedures using conventional pharmaceutical excipients, well known in the art. Thus, compositions intended for oral use may contain, for example, one or more colouring, sweetening, flavouring and/or preservative agents.

5 Suitable pharmaceutically acceptable excipients for a tablet formulation include, for example, inert diluents such as lactose, sodium carbonate, calcium phosphate or calcium carbonate, granulating and disintegrating agents such as corn starch or algenic acid; binding agents such as starch; lubricating agents such as magnesium stearate, stearic acid or talc; preservative agents such as ethyl or propyl
10 p-hydroxybenzoate, and anti-oxidants, such as ascorbic acid. Tablet formulations may be uncoated or coated either to modify their disintegration and the subsequent absorption of the active ingredient within the gastrointestinal track, or to improve their stability and/or appearance, in either case, using conventional coating agents and procedures well known in the art.

15 Compositions for oral use may be in the form of hard gelatin capsules in which the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules in which the active ingredient is mixed with water or an oil such as peanut oil, liquid paraffin, or olive oil.

 Aqueous suspensions generally contain the active ingredient in finely powdered
20 form together with one or more suspending agents, such as sodium carboxymethylcellulose, methylcellulose, hydroxypropylmethylcellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents such as lecithin or condensation products of an alkylene oxide with fatty acids (for example polyoxyethylene stearate), or condensation products of ethylene oxide
25 with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example
 heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial
30 esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters derived

from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives (such as ethyl or propyl p-hydroxybenzoate, anti-oxidants (such as ascorbic acid), colouring agents, flavouring agents, and/or sweetening agents (such as sucrose, 5 saccharine or aspartame).

Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil (such as arachis oil, olive oil, sesame oil or coconut oil) or in a mineral oil (such as liquid paraffin). The oily suspensions may also contain a thickening agent such as beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set 10 out above, and flavouring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water generally contain the active ingredient together 15 with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients such as sweetening, flavouring and colouring agents, may also be present.

The pharmaceutical compositions of the invention may also be in the form of 20 oil-in-water emulsions. The oily phase may be a vegetable oil, such as olive oil or arachis oil, or a mineral oil, such as for example liquid paraffin or a mixture of any of these. Suitable emulsifying agents may be, for example, naturally-occurring gums such as gum acacia or gum tragacanth, naturally-occurring phosphatides such as soya bean, lecithin, an esters or partial esters derived from fatty acids and hexitol anhydrides (for 25 example sorbitan monooleate) and condensation products of the said partial esters with ethylene oxide such as polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening, flavouring and preservative agents.

Syrups and elixirs may be formulated with sweetening agents such as glycerol, propylene glycol, sorbitol, aspartame or sucrose, and may also contain a demulcent, 30 preservative, flavouring and/or colouring agent.

The pharmaceutical compositions may also be in the form of a sterile injectable aqueous or oily suspension, which may be formulated according to known procedures using one or more of the appropriate dispersing or wetting agents and suspending agents, which have been mentioned above. A sterile injectable preparation may also be
5 a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example a solution in 1,3-butanediol.

Suppository formulations may be prepared by mixing the active ingredient with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug.
10 Suitable excipients include, for example, cocoa butter and polyethylene glycols.

Topical formulations, such as creams, ointments, gels and aqueous or oily solutions or suspensions, may generally be obtained by formulating an active ingredient with a conventional, topically acceptable, vehicle or diluent using conventional procedure well known in the art.

15 Compositions for administration by insufflation may be in the form of a finely divided powder containing particles of average diameter of, for example, 30 μ or much less, the powder itself comprising either active ingredient alone or diluted with one or more physiologically acceptable carriers such as lactose. The powder for insufflation is then conveniently retained in a capsule containing, for example, 1 to 50mg of active
20 ingredient for use with a turbo-inhaler device, such as is used for insufflation of the known agent sodium cromoglycate.

Compositions for administration by inhalation may be in the form of a conventional pressurised aerosol arranged to dispense the active ingredient either as an aerosol containing finely divided solid or liquid droplets. Conventional aerosol
25 propellants such as volatile fluorinated hydrocarbons or hydrocarbons may be used and the aerosol device is conveniently arranged to dispense a metered quantity of active ingredient.

For further information on Formulation the reader is referred to Chapter 25.2 in Volume 5 of Comprehensive Medicinal Chemistry (Corwin Hansch; Chairman of
30 Editorial Board), Pergamon Press 1990.

The amount of active ingredient that is combined with one or more excipients to produce a single dosage form will necessarily vary depending upon the host treated and the particular route of administration. For example, a formulation intended for oral administration to humans will generally contain, for example, from 0.5 mg to 2 g of active agent compounded with an appropriate and convenient amount of excipients which may vary from about 5 to about 98 percent by weight of the total composition. Dosage unit forms will generally contain about 1 mg to about 500 mg of an active ingredient. For further information on Routes of Administration and Dosage Regimes the reader is referred to Chapter 25.3 in Volume 5 of Comprehensive Medicinal Chemistry (Corwin Hansch; Chairman of Editorial Board), Pergamon Press 1990.

The size of the dose for therapeutic or prophylactic purposes of a compound of the Formula I will naturally vary according to the nature and severity of the conditions, the age and sex of the animal or patient and the route of administration, according to well known principles of medicine. As mentioned above, compounds of the Formula I are useful in treating diseases or medical conditions which are due alone or in part to the effects of aurora 2 kinase.

In using a compound of the Formula I for therapeutic or prophylactic purposes it will generally be administered so that a daily dose in the range, for example, 0.5 mg to 75 mg per kg body weight is received, given if required in divided doses. In general lower doses will be administered when a parenteral route is employed. Thus, for example, for intravenous administration, a dose in the range, for example, 0.5 mg to 30 mg per kg body weight will generally be used. Similarly, for administration by inhalation, a dose in the range, for example, 0.5 mg to 25 mg per kg body weight will be used.

The treatment defined hereinbefore may be applied as a sole therapy or may involve, in addition to the use of the compounds in accordance with the invention and/or compounds of the invention, one or more other substances and/or treatments. Such conjoint treatment may be achieved by way of simultaneous, sequential or separate administration of the individual components of the treatment. In the field of medical oncology it is normal practice to use a combination of different forms of treatment to treat each patient with cancer. The other components of such conjoint

treatment may be, for example, surgery, radiotherapy or chemotherapy. Such chemotherapy may include one or more of the following categories of therapeutic agents :-

- (i) anti-invasion agents (for example metalloproteinase inhibitors like marimastat and inhibitors of urokinase plasminogen activator receptor function);
- (ii) anti-proliferative/anti-neoplastic drugs and combinations thereof, as used in medical oncology, such as platinum derivatives (for example cis-platin, carboplatin); alkylating agents (for example cyclophosphamide, nitrogen mustard, melphalan, chlorambucil, busulphan and nitrosoureas); anti-metabolites (for example anti-folates such as fluoropyrimidines like 5-fluorouracil and tegafur, raltitrexed, methotrexate, cytosine arabinoside and hydroxyurea); anti-tumour antibiotics (for example anthracyclines like adriamycin, bleomycin, doxorubicin, daunomycin, epirubicin, idarubicin, mitomycin-C, dactinomycin and mithramycin); anti-mitotic agents (for example vinca alkaloids like vincristine, vinblastine, vindesine and vinorelbine and taxoids like taxol and taxotere); and topoisomerase inhibitors (for example epipodophyllotoxins like etoposide and teniposide, amsacrine, topotecan and camptothecin);
- (iii) cytostatic agents such as anti-oestrogens (for example tamoxifen, toremifene, raloxifene, droloxifene and idoxifene); anti-androgens (for example bicalutamide, flutamide, nilutamide and cyproterone acetate); LHRH antagonists or LHRH agonists (for example goserelin, leuprorelin and buserelin); progestogens (for example megestrol acetate); aromatase inhibitors (for example as anastrozole, letrozole, vorazole and exemestane) and inhibitors of 5-reductase such as finasteride;
- (iv) inhibitors of growth factor function, for example such inhibitors include growth factor antibodies, growth factor receptor antibodies, tyrosine kinase inhibitors and serine/threonine kinase inhibitors, for example inhibitors of the epidermal growth factor family (for example EGFR tyrosine kinase inhibitors) for example inhibitors of the platelet-derived growth factor family and for example inhibitors of the hepatocyte growth factor family; and
- (v) antiangiogenic agents such as those which inhibit vascular endothelial growth factor such as the compounds disclosed in International Patent Applications

WO 97/22596, WO 97/30035, WO 97/32856 and WO 98/13354 and those that work by other mechanisms (for example linomide, inhibitors of integrin $\alpha v \beta 3$ function and angiostatin).

Such combination products employ the compounds of this invention within the dosage range described hereinbefore and the other pharmaceutically-active agent within its approved dosage range.

The following Examples illustrate the invention.

Example 1 – Preparation of Compound No. 1 in Table 1

A solution of 4-chloro-6,7-dimethoxyquinazoline (3.176 g, 14.13 mmol) and N-benzoyl 4-aminoaniline (3.00 g, 14.13 mmol) in isopropanol (200 ml) was heated at reflux for 3 hours before the reaction was allowed to cool to ambient temperature. The solid which had precipitated was collected by suction filtration and washed with diethyl ether (2 x 50 ml). Drying of this material yielded the title compound (5.66 g, 92 % yield) as a pale-yellow solid :

¹H-NMR (DMSO d₆) : 11.29 (s, 1H), 10.39 (s, 1H), 8.80 (s, 1H), 8.25 (s, 1H), 7.98 (d, 2H, J = 8 Hz), 7.89 (d, 2H, J = 8 Hz), 7.65 (d, 2H, J = 8 Hz), 7.50-7.63 (m, 3H), 7.32 (s, 1H), 4.00 (s, 3H), 3.98 (s, 3H) :

MS (+ve ESI) : 401 (M+H)⁺.

4-Chloro-6,7-dimethoxyquinazoline and N-benzoyl 4-aminoaniline, used as the starting materials were obtained as follows :

a) A mixture of 4,5-dimethoxyanthranilic acid (19.7 g, 100 mmol) and formamide (10 ml) was heated at 190 °C for 5 hours. The mixture was allowed to cool to

approximately 80 °C and water (50 ml) was added. The mixture was then allowed to stand at ambient temperature for 3 hours. Collection of the solid by suction filtration, followed by washing with water (2 x 50 ml) and drying *in vacuo*, yielded 6,7-dimethoxy-3,4-dihydroquinazolin-4-one (3.65 g, 18 % yield) as a white solid :

5 ¹H-NMR (DMSO d₆) : 12.10 (s, 1H), 7.95 (s, 1H), 7.42 (s, 1H), 7.11 (s, 1H), 3.88 (s, 3H), 3.84 (s, 3H) :

MS (-ve ESI) : 205 (M-H)⁻.

b) Dimethylformamide (0.2 ml) was added dropwise to a solution of 6,7-dimethoxy-3,4-dihydro-quinazolin-4-one (10.0 g, 48.5 mmol) in thionyl chloride (200
10 ml) and the reaction was heated at reflux for 6 hours. The reaction was cooled, excess thionyl chloride was removed *in vacuo* and the residue was azeotroped with toluene (2 x 50 ml) to remove the last of the thionyl chloride. The residue was taken up in dichloromethane (550 ml), the solution was washed with saturated aqueous sodium hydrogen carbonate solution (2 x 250 ml) and the organic phase was dried over
15 magnesium sulphate. Solvent evaporation *in vacuo* yielded 4-chloro-6,7-dimethoxyquinazoline (10.7 g, 98 % yield) as a white solid :

¹H-NMR (DMSO d₆) : 8.86 (s, 1H), 7.42 (s, 1H), 7.37 (s, 1H), 4.00 (s, 3H), 3.98 (s, 3H) :

MS (+ve ESI) : 225 (M+H)⁺.

20 c) Benzoyl chloride (10.7 ml, 92.5 mmol) was added to a stirred solution of 1,4-phenylenediamine (10.0 g, 92.5 mmol) and triethylamine (14.2 ml, 102 mmol) in dichloromethane (250 ml) at 0 °C. The reaction was allowed to warm to ambient temperature over 3 hours, the solid was filtered off and water (100 ml) was added to the filtrate, causing precipitation of a second solid. Collection of this solid by suction
25 filtration and drying *in vacuo* yielded N-benzoyl 4-aminoaniline (5.55 g, 28 % yield) as a white solid :

Biological Data

The compounds of the invention inhibit the serine/threonine kinase activity of the aurora2 kinase and thus inhibit the cell cycle and cell proliferation. These properties may be assessed, for example, using one or more of the procedures set out below:

(a) In Vitro aurora2 kinase inhibition test

This assay determines the ability of a test compound to inhibit serine/threonine kinase activity. DNA encoding aurora2 may be obtained by total gene synthesis or by cloning. This DNA may then be expressed in a suitable expression system to obtain polypeptide with serine/threonine kinase activity. In the case of aurora2, the coding sequence was isolated from cDNA by polymerase chain reaction (PCR) and cloned into the BamH1 and Not1 restriction endonuclease sites of the baculovirus expression vector pFastBac HTc (GibcoBRL/Life technologies). The 5' PCR primer contained a recognition sequence for the restriction endonuclease BamH1 5' to the aurora2 coding sequence. This allowed the insertion of the aurora2 gene in frame with the 6 histidine residues, spacer region and rTEV protease cleavage site encoded by the pFastBac HTc vector. The 3' PCR primer replaced the aurora2 stop codon with additional coding sequence followed by a stop codon and a recognition sequence for the restriction endonuclease Not1. This additional coding sequence (5' TAC CCA TAC GAT GTT CCA GAT TAC GCT TCT TAA 3') encoded for the polypeptide sequence YPYDVDPDYAS. This sequence, derived from the influenza hemagglutinin protein, is frequently used as a tag epitope sequence that can be identified using specific monoclonal antibodies. The recombinant pFastBac vector therefore encoded for an N-terminally 6 his tagged, C terminally influenza hemagglutinin epitope tagged aurora2 protein. Details of the methods for the assembly of recombinant DNA molecules can be found in standard texts, for example Sambrook et al. 1989, Molecular Cloning - A Laboratory Manual, 2nd Edition, Cold Spring Harbor Laboratory press and Ausubel et al. 1999, Current Protocols in Molecular Biology, John Wiley and Sons Inc.

Production of recombinant virus can be performed following manufacturer's protocol from GibcoBRL. Briefly, the pFastBac-1 vector carrying the aurora2 gene was transformed into E. coli DH10Bac cells containing the baculovirus genome (bacmid DNA) and via a transposition event in the cells, a region of the pFastBac vector containing gentamycin resistance gene and the aurora2 gene including the baculovirus polyhedrin promoter was transposed directly into the bacmid DNA. By selection on gentamycin, kanamycin, tetracycline and X-gal, resultant white colonies should contain recombinant bacmid DNA encoding aurora2. Bacmid DNA was

extracted from a small scale culture of several BH10Bac white colonies and transfected into *Spodoptera frugiperda* Sf21 cells grown in TC100 medium (GibcoBRL) containing 10% serum using CellFECTIN reagent (GibcoBRL) following manufacturer's instructions. Virus particles were harvested by collecting cell culture medium 72 hrs post transfection. 0.5 mls of medium was used to infect 100 ml suspension culture of Sf21s containing 1×10^7 cells/ml. Cell culture medium was harvested 48 hrs post infection and virus titre determined using a standard plaque assay procedure. Virus stocks were used to infect Sf9 and "High 5" cells at a multiplicity of infection (MOI) of 3 to ascertain expression of recombinant aurora2 protein.

For the large scale expression of aurora2 kinase activity, Sf21 insect cells were grown at 28°C in TC100 medium supplemented with 10% foetal calf serum (Viralex) and 0.2% F68 Pluronic (Sigma) on a Wheaton roller rig at 3 r.p.m. When the cell density reached 1.2×10^6 cells.ml⁻¹ they were infected with plaque-pure aurora2 recombinant virus at a multiplicity of infection of 1 and harvested 48 hours later. All subsequent purification steps were performed at 4°C. Frozen insect cell pellets containing a total of 2.0×10^8 cells were thawed and diluted with lysis buffer (25 mM HEPES (N-[2-hydroxyethyl]piperazine-N'-[2-ethanesulphonic acid]) pH7.4 at 4°C, 100 mM KCl, 25 mM NaF, 1 mM Na₃VO₄, 1 mM PMSF (phenylmethylsulphonyl fluoride), 2 mM 2-mercaptoethanol, 2 mM imidazole, 1 µg/ml aprotinin, 1 µg/ml pepstatin, 1 µg/ml leupeptin), using 1.0 ml per 3×10^7 cells. Lysis was achieved using a dounce homogeniser, following which the lysate was centrifuged at 41,000g for 35 minutes. Aspirated supernatant was pumped onto a 5 mm diameter chromatography column containing 500 µl Ni NTA (nitrilo-tri-acetic acid) agarose (Qiagen, product no. 30250) which had been equilibrated in lysis buffer. A baseline level of UV absorbance for the eluent was reached after washing the column with 12 ml of lysis buffer followed by 7 ml of wash buffer (25 mM HEPES pH7.4 at 4°C, 100 mM KCl, 20 mM imidazole, 2 mM 2-mercaptoethanol). Bound aurora2 protein was eluted from the column using elution buffer (25 mM HEPES pH7.4 at 4°C, 100 mM KCl, 400 mM imidazole, 2 mM 2-mercaptoethanol). An elution fraction (2.5 ml) corresponding to the peak in UV absorbance was collected. The elution fraction, containing active aurora2 kinase, was dialysed exhaustively against dialysis buffer (25 mM HEPES

pH7.4 at 4°C, 45% glycerol (v/v), 100 mM KCl, 0.25% Nonidet P40 (v/v), 1 mM dithiothreitol).

Each new batch of aurora2 enzyme was titrated in the assay by dilution with enzyme diluent (25mM Tris-HCl pH7.5, 12.5mM KCl, 0.6mM DTT). For a typical
5 batch, stock enzyme is diluted 1 in 666 with enzyme diluent & 20µl of dilute enzyme is used for each assay well. Test compounds (at 10mM in dimethylsulphoxide (DMSO)) were diluted with water & 10µl of diluted compound was transferred to wells in the assay plates. "Total" & "blank" control wells contained 2.5% DMSO instead of compound. Twenty microlitres of freshly diluted enzyme was added to all
10 wells, apart from "blank" wells. Twenty microlitres of enzyme diluent was added to "blank" wells. Twenty microlitres of reaction mix (25mM Tris-HCl, 78.4mM KCl, 2.5mM NaF, 0.6mM dithiothreitol, 6.25mM MnCl₂, 6.25mM ATP, 7.5µM peptide substrate [biotin-LRRWSLGLRRWSLGLRRWSLGLRRWSLG]) containing 0.2µCi [γ ³³P]ATP (Amersham Pharmacia, specific activity ≥ 2500 Ci/mmol) was then added to
15 all test wells to start the reaction. The plates were incubated at room temperature for 60 minutes. To stop the reaction 100µl 20% v/v orthophosphoric acid was added to all wells. The peptide substrate was captured on positively-charged nitrocellulose P30 filtermat (Whatman) using a 96-well plate harvester (TomTek) & then assayed for incorporation of ³³P with a Beta plate counter. "Blank" (no enzyme) and "total" (no
20 compound) control values were used to determine the dilution range of test compound which gave 50% inhibition of enzyme activity.

In this test, compound 1 in Table 1 gave 50% inhibition of enzyme activity at a concentration of 0.374 µM and compound 101 in Table 4 gave 50% inhibition of enzyme activity at a concentration of 0.0193µM. In this test, compound
25 557 in Table 16 gave 50% inhibition of enzyme activity at a concentration of 0.519µM.

(b) In Vitro cell proliferation assay

These and other assays can be used to determine the ability of a test compound to inhibit the growth of adherent mammalian cell lines, for example the human tumour
30 cell line MCF7.

Assay 1: MCF-7 (ATCC HTB-22) or other adherent cells were typically seeded at 1×10^3 cells per well (excluding the peripheral wells) in DMEM (Sigma Aldrich) without phenol red, plus 10% foetal calf serum, 1% L-glutamine and 1% penicillin/streptomycin in 96 well tissue culture treated clear plates (Costar). The following day (day 1), the media was removed from a no treatment control plate and the plate stored at -80°C . The remaining plates were dosed with compound (diluted from 10mM stock in DMSO using DMEM (without phenol red, 10% FCS, 1% L-glutamine, 1% penicillin/streptomycin). Untreated control wells were included on each plate. After 3 days in the presence / absence of compound (day 4) the media was removed and the plates stored at -80°C . Twenty four hours later the plates were thawed at room temperature and cell density determined using the CyQUANT cell proliferation assay kit (c-7026/c-7027 Molecular Probes Inc.) according to manufacturers directions. Briefly, 200 μl of a cell lysis / dye mixture (10 μl of 20X cell lysis buffer B, 190 μl of sterile water, 0.25 μl of CYQUANT GR dye) was added to each well and the plates incubated at room temperature for 5 minutes in the dark. The fluorescence of the wells was then measured using a fluorescence microplate reader (gain 70, 2 reads per well, 1 cycle with excitation 485nm and emission 530nm using a CytoFluor plate reader (PerSeptive Biosystems Inc.)). The values from day 1 and day 4 (compound treated) together with the values from the untreated cells were used to determine the dilution range of a test compound that gave 50% inhibition of cell proliferation. Compound no.1 in Table 1 was effective in this test at $8.03\mu\text{M}$ and compound no.101 in Table 4 was effective in this test at $1.06\mu\text{M}$. Compound 557 in Table 16 was effective in this test at $1.57\mu\text{M}$. These values could also be used to calculate the dilution range of a test compound at which the cell density dropped below the day 1 control value. This indicates the cytotoxicity of the compound.

Assay 2: This assay determines the ability of a test compound to inhibit the incorporation of the thymidine analogue, 5'-bromo-2'-deoxy-uridine (BrdU) into cellular DNA. MCF-7 or other adherent cells were typically seeded at 0.8×10^4 cells per well in DMEM (Sigma Aldrich) without phenol red, plus 10% foetal calf serum, 1% L-glutamine and 1% penicillin/streptomycin (50 μl / well) in 96 well tissue culture treated 96 well plates (Costar) and allowed to adhere overnight. The following day the

cells were dosed with compound (diluted from 10mM stock in DMSO using DMEM (without phenol red, 10% FCS, 1% L-glutamine, 1% penicillin/streptomycin).

Untreated control wells and wells containing a compound known to give 100% inhibition of BrdU incorporation were included on each plate. After 48 hours in the presence / absence of test compound the ability of the cells to incorporate BrdU over a 2 hour labelling period was determined using a Boehringer (Roche) Cell Proliferation BrdU ELISA kit (cat. No. 1 647 229) according to manufacturers directions. Briefly, 15µl of BrdU labelling reagent (diluted 1:100 in media - DMEM no phenol red, 10% FCS, 1% L-glutamine, 1% penicillin/streptomycin) was added to each well and the plate returned to a humidified (+5% CO₂) 37°C incubator for 2 hours. After 2 hours the labelling reagent was removed by decanting and tapping the plate on a paper towel. FixDenat solution (50µl per well) was added and the plates incubated at room temperature for 45mins with shaking. The FixDenat solution was removed by decanting and tapping the inverted plate on a paper towel. The plate was then washed once with phosphate buffered saline (PBS) and 100µl /well of Anti-BrdU-POD antibody solution (diluted 1:100 in antibody dilution buffer) added. The plate was then incubated at room temperature with shaking for 90min. Unbound Anti-BrdU-POD antibody was removed by decanting and washing the plate 5 times with PBS before being blotted dry. TMB substrate solution was added (100µl/well) and incubated for approximately 10 minutes at room temperature with shaking until a colour change was apparent. The optical density of the wells was then determined at 690nm wavelength using a Titertek Multiscan plate reader. The values from compound treated, untreated and 100% inhibition controls were used to determine the dilution range of a test compound that gave 50% inhibition of BrdU incorporation. Compound 1 in Table 1 was effective in this test at 1.245 µM and Compound 101 in Table 4 was effective in at from 0.159-0.209µM

(c) In Vitro cell cycle analysis assay

This assay determines the ability of a test compound to arrest cells in specific phases of the cell cycle. Many different mammalian cell lines could be used in this assay and MCF7 cells are included here as an example. MCF-7 cells were seeded at 3 x 10⁵ cells per T25 flask (Costar) in 5 ml DMEM (no phenol red 10% FCS, 1%

L-glutamine 1% penicillin / streptomycin). Flasks were then incubated overnight in a humidified 37°C incubator with 5% CO₂. The following day 1ml of DMEM (no phenol red 10% FCS, 1% L-glutamine 1% penicillin / streptomycin) carrying the appropriate concentration of test compound solubilised in DMSO was added to the flask. A no compound control treatments was also included (0.5% DMSO). The cells were then incubated for a defined time (usually 24 hours) with compound. After this time the media was aspirated from the cells and they were washed with 5ml of prewarmed (37°C) sterile PBSA, then detached from the flask by brief incubation with trypsin and followed by resuspension in 10ml of 1% Bovine Serum Albumin (BSA, Sigma-Aldrich Co.) in sterile PBSA. The samples were then centrifuged at 2200rpm for 10 min. The supernatant was aspirated and the cell pellet was resuspended in 200µl of 0.1% (w/v) Tris sodium citrate, 0.0564% (w/v) NaCl, 0.03% (v/v) Nonidet NP40, [pH 7.6]. Propidium Iodide (Sigma Aldrich Co.) was added to 40µg/ml and RNAase A (Sigma Aldrich Co.) to 100µg/ml. The cells were then incubated at 37°C for 30 minutes. The samples were centrifuged at 2200rpm for 10 min, the supernatant removed and the remaining pellet (nuclei) resuspended in 200µl of sterile PBSA. Each sample was then syringed 10 times using 21 gauge needle. The samples were then transferred to LPS tubes and DNA content per cell analysed by Fluorescence activated cell sorting (FACS) using a FACScan flow cytometer (Becton Dickinson). Typically 25000 events were counted and recorded using CellQuest v1.1 software (Verity Software). Cell cycle distribution of the population was calculated using Modfit software (Verity Software) and expressed as percentage of cells in G0/G1, S and G2/M phases of the cell cycle. Treating MCF7 cells with 25µM Compound 1 in table 1 or 2.12µM of Compound 101 in Table 4 for 24 hours produced the following changes in cell cycle distribution:

Treatment	% Cells in G1	% Cells in S	% Cells in G2/M
DMSO (control - Comp 1)	49.9	39.2	10.9
25µM Compound 1	25.82	17.71	56.47
DMSO (control - Comp 101)	57.5	31.95	10.55
2.12µM Compound 101	19.69	12.4	68.21

(Any replacement sheet containing such amendments must be referred to under item 1 and annexed to this report.)

6. Additional observations, if necessary:

III. Non-establishment of opinion with regard to novelty, inventive step and industrial applicability

1. The questions whether the claimed invention appears to be novel, to involve an inventive step (to be non-obvious), or to be industrially applicable have not been examined in respect of:

☐ the entire international application.

☒ claims Nos. 28.

because:

☒ the said international application, or the said claims Nos. relate to the following subject matter which does not require an international preliminary examination (*specify*):
see separate sheet

☐ the description, claims or drawings (*indicate particular elements below*) or said claims Nos. are so unclear that no meaningful opinion could be formed (*specify*):

☐ the claims, or said claims Nos. are so inadequately supported by the description that no meaningful opinion could be formed.

☐ no international search report has been established for the said claims Nos. .

2. A meaningful international preliminary examination cannot be carried out due to the failure of the nucleotide and/or amino acid sequence listing to comply with the standard provided for in Annex C of the Administrative Instructions:

☐ the written form has not been furnished or does not comply with the standard.

☐ the computer readable form has not been furnished or does not comply with the standard.

V. Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

VIII. Certain observations on the international application

The following observations on the clarity of the claims, description, and drawings or on the question whether the claims are fully supported by the description, are made:

1. Claim 28 relates to subject-matter considered by this Authority to be covered by the provisions of Rule 67.1(iv) PCT. Consequently, no opinion will be formulated with respect to the industrial applicability of the subject-matter of this claim (Article 34(4)(a)(i) PCT).

The indicated designation will be used throughout the examination procedure.

3. Novelty

Claims 1-18 and 31 are use claims directed to "the preparation of a medicament for use in the inhibition of aurora 2 kinase".

Claims 19-25 are product claims whereby claims 19-24 are formulated independently, The process Claim 27, the product for use claim 29 and the pharmaceutical composition of Claim 30 refer to certain product claims.

3.1 The Applicant obviously intended to delimit Claims 1-18 and 31 by the inclusion of the discovery that the compounds should inhibit aurora 2 kinase. Since this is not a disease rather the mode of action in terms of a mechanism this cannot be considered as a limiting feature which remains outside consideration when evaluating novelty.

D11 discloses the diagnosis and treatment of Aurora 1 and Aurora 2 disorders but no reference to quinazolines is apparent. All the other documents D1 -D10 disclose quinazolines useful as medicaments to treat e.g. cancer.

The compounds of D4-D7 differ structurally from the compounds referred to in Claim 1

THIS PAGE BLANK (USPTO)

THIS PAGE BLANK (USPTO)

by the fact in that the substituent corresponding to R⁵ of the application is different from the corresponding R³ substituents considered according to D4-D7. The compounds referred to in Claim 1 are comprised by D2 but it would appear that no specific compounds are disclosed therein falling within the group of compounds of Claim 1 on file (the compounds 155-157 of table 1 of page 10 as well as the compounds 61-84 of table 1 of page 14 are quinolines).

On the other hand Claim 1 on file comprises compounds already known from the prior art D1 (see Claim 1 and the examples 1^a-9ⁱ of column 37), D3 (see claim 1 and e.g. Examples 90-95 etc.), D8 (see e.g. Claim 1 and Example 11), D9 (see e.g. Claim 1 and Example 33), D10 (see e.g. Claim 1 and the fifth compound of column 21).

For the above reasons at least Claim 1 cannot be considered to be novel.

3.2 The provisos of independent product Claims 19 and 20 as well as 21 and 22 are unclear in that the corresponding prior art has not been indicated. Furthermore it would appear that the claims in question are in spite of the provisos not novel in view of e.g. D3 (see e.g. the compounds of examples 94 and 95).

Independently formulated product Claim 23 is also not novel having regard to e.g. D1 (examples 1^a-9ⁱ of column 37). This applies also to Claims 24 and 25.

3.3 As far as the compounds are not novel Claims 29 and 30 can also not be considered to be novel.

The following observations apply to subject matter which could be considered to be novel.

4. Inventive Step - Breadth of Claims - Non-unity a posteriori

4.1 Subjective Problem

According to the application (p. 1, first paragraph) the problem underlying the invention is to be seen in the provision of further compounds useful to treat proliferative diseases such as cancer.

4.2 Relevant and closest prior art

Since the documents D1-D10 disclose quinazolines which come structurally close to compounds of the application and are also useful to treat cancer these documents are considered to be relevant for the assessment of inventive step.

The closest prior art is for the time being considered to be D1.

4.3 Objectively solved problem and evaluation

The application documents contain the test methodology and the quantitative test

results of 3 compounds namely compounds 1, 101 and 557. At present not even these compounds can be considered to be inventive in view of the cited prior art.

The person skilled in the art seeking a solution to the problem defined above would therefore have been prompted to consider further derivatives of compounds which are closely related to the cited prior art.

The fact that a new mode of action has been discovered (mechanism of action) is no argument in favour of the acknowledgement of an inventive step as long as this is not connected with a surprising activity or effect. No such surprising macroscopic effects have been demonstrated.

4.4 Breadth of the claims

The breadth should be such that it can be assumed that all the comprised possibilities actually solve the problem underlying the invention on which an inventive step could be based. Even if it turns out that the tested compounds (wherein R^1 , R^4 , R^7 and $R^8 = H$; $R^2 = OCH_3$; $R^3 = OCH_3$, $O(CH_2)_3$ -morpholino; $X = NH$; $R^5 = NH$ -2-indolyl, $NHCO$ -nitropyrrolyl, $CONH$ -fluorobenzyl) have a surprising activity on which an inventive step could be based the proposed broadness of Claim 1 is not acceptable. It is true that a **reasonable** generalisation of findings on which an inventive step could be based is acceptable but it would appear that expressions like "ester", "prodrug", "optionally substituted", "hydrocarbyl", "heterocyclyl", "alkoxy" with undefined C-range are unreasonable generalisations.

4.5 Non-unity a posteriori

As a precautionary measure it is pointed out that depending on the claims which are filed and which could be considered to be novel a non-unity objection might arise.

5. Industrial applicability

For the assessment of the present claims 28 on the question whether they are industrially applicable, no unified criteria exist in the PCT Contracting States. The patentability can also be dependent upon the formulation of the claims. The EPO, for example, does not recognize as industrially applicable the subject-matter of claims to the use of a compound in medical treatment, but may allow, however, claims to a known compound for first use in medical treatment and the use of such a compound for the manufacture of a medicament for a new medical treatment.

6. It is indicated that the presence of provisos render the claims unclear in the sense of ready comprehensibility. In a possible regional or national examination phase, it is likely that further provisos will not be acceptable.
